3.2 Backlight Unit

Parameter guideline for LED driving is under stable conditions at 25℃ (Room Temperature):

Parameter		Symbol	Value			Unit	Note
			Min.	Typ.	Max.		
Converter Power Supply Voltage		V_i	10.8	12.0	13.2	V	
Converter Power Supply Current		I_i	--	0.45	0.5	A	@ Vi = 12V (Duty 100%)
Backlight Power Consumption		P_{BL}	-	5.3	5.8	W	@ Vi = 12V (Duty 100%)

PWM Control Duty Ratio		-	1	-	100	%	@200Hz
PWM Control Frequency		f_{PWM}	190	200	20k	Hz	(2)
LED LifeTime		L_L	50,000	-	-	Hrs	(3)

Note (1) LED current is measured by utilizing a high frequency current meter as shown below:

Note (2)At 200 Hz PWM control frequency，duty ratio range is restricted from 1% to 100%

Note (3) The lifetime of LED is estimated data and defined as the time when it continues to operate under the conditions at

Ta = 25 ±2 ℃ and Duty=100% until the brightness becomes ≦ 50% of its original value.

Operating LED under high temperature environment will reduce lifetime and lead to color shift.
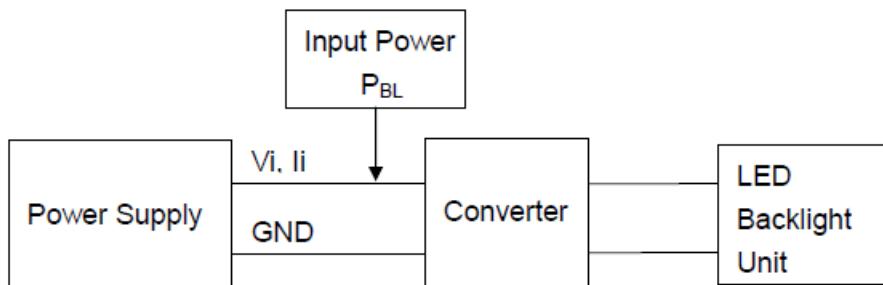

Power sequence and control signal timing are shown in the following figure
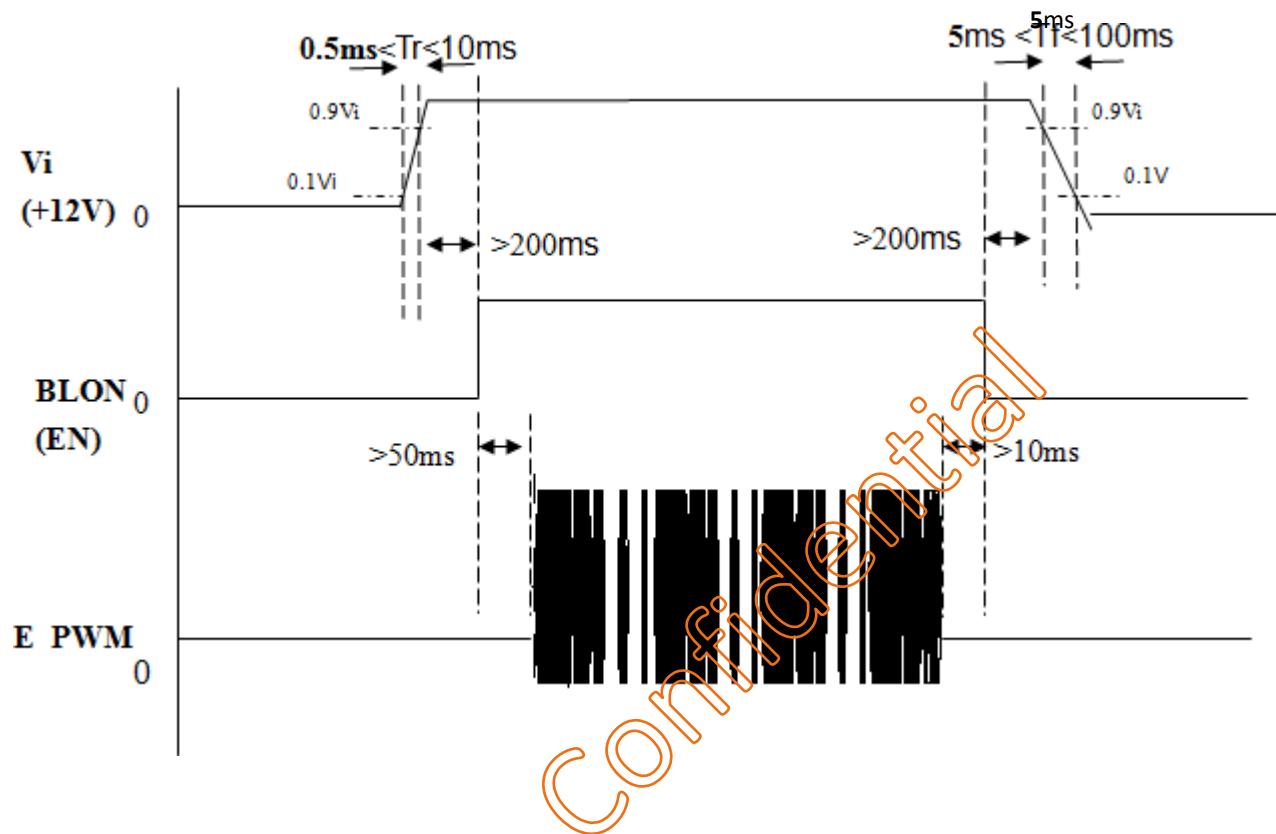

Note： While system is turned ON or OFF, the power sequences must follow as below

descriptions Turn ON sequence: Vi(+12V) → BLON → E_PWM signal

Turn OFF sequence: E_PWM signal → BLON → Vi(+12V)

The following optical specifications shall be measured in a darkroom or equivalent state (ambient luminance <2 lux, and at room temperature).

The room temperature is 25°C±2°C

Note 1:   Definition of Viewing Angle

Viewing angle is the angle at which the contrast ratio is greater than 10. The viewing angles are determined for the horizontal or the vertical clock direction with respect to the optical axis   which is normal to the LCD surface
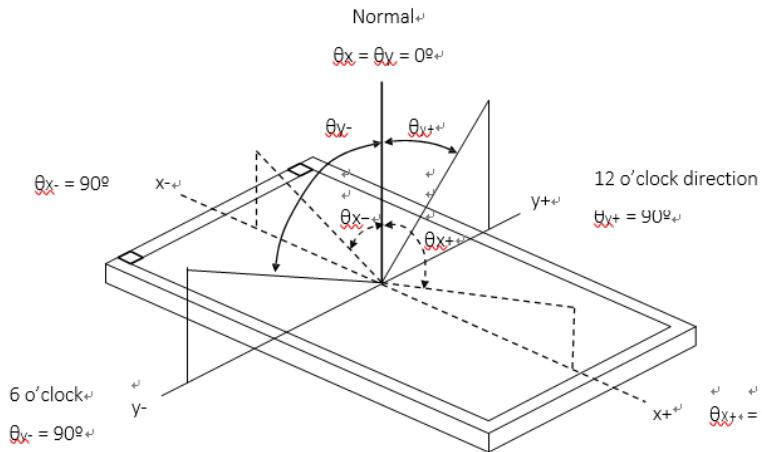

Note 2:   Definition of Contrast Ratio (CR)

Measure the viewing angle of Θ= 0 and at the center of the LCD surface. Luminance with all pixels in white state divide by Luminance with all pixels in Black state

Note 3   Definition of Response Time:

The response time is set initially by defining the "Rising Time (Tr)" and the "Falling Time (Tf)" respectively. The response time interval is between 10% and 90% of amplitudes, please refer the figure to the followings:
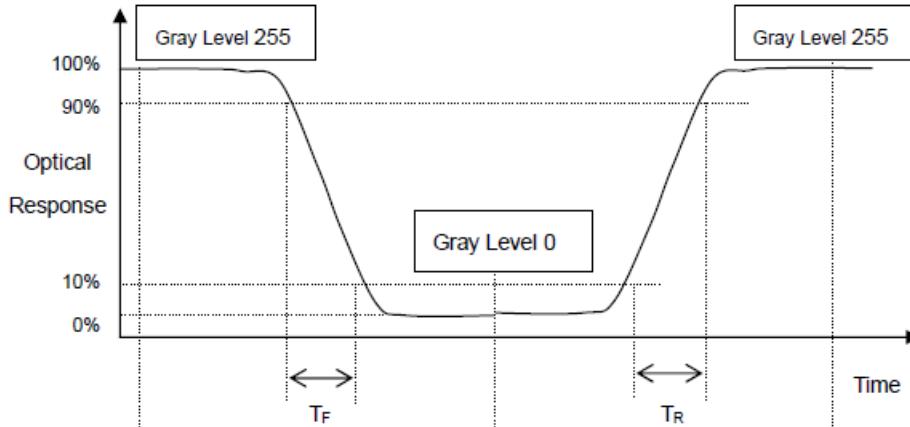

Note 4:   Definition of Brightness (Lc)

Measure the center area of the panel and the viewing angle of the $\theta x = \theta y = 0°$

Note 5:   The method of optical measurement:
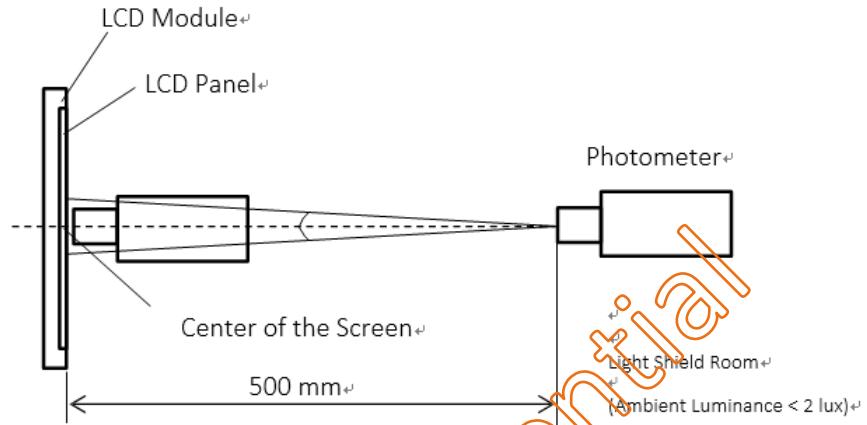

Note 6:   Definition of White Variation (δW):

Measure the luminance of gray level 255 at 9 points

δW = Maximum [L (1), L (2), L (3)…L (8), L (9)] / Minimum [L (1), L (2), L (3)… L (4), L (5)]

10. PRECAUTION AND PRODUCT HANDLING

- Do not apply the external force such as bending or twisting to the LCD panel and backlight during assembly.
- Do not insert and plug out the input connector while the LCD panel is operating.
- Do not take apart the panel or frame from LCD module assembly or insert anything into the backlight unit.
- Do not keep the same pattern in a long period of time, it may cause image sticking on LCD panel. Can use shuffle content periodically if fixed pattern is displayed on the screen.
- Do not touch the display area with bare hands, this will stain the display area.
- Pay attention to handle lead wire of backlight, that is not tugged in connect with LED driver.
- Do not change variable resistance settings in LCD panel, it may cause not satisfy of LCD characteristics specification.
- The surface of LCD panel's polarizer is very soft and easily scratched, please use a very soft dry cloth without chemicals for cleaning.
- To avoid the static electricity to damage the CMOS LSI, the operator should be grounded when in contact with the LCD panel, and also to all electrical equipment.
- Need to follow the correct power frequency when LCD panel is connecting and operating, this can avoid damage to CMOS LSI during latch-up.
