

In order to meet your expectations, we have developed the MODBUS sensor. It now integrates the following evolutions:

- **KARE+ compliant**
The KARE+ offer allowing the simultaneous update of a fleet of Adeunis sensors.
- **Personnalisation of the join phase**
Possibility to configure all the characteristics linked to the join phase (number of tries per attempt...).
- **Network test at startup**
During the join phase the sensor exchanges with the gateway and determines the quality of the radio link on site. The result of this test is given to the installer via the LEDs on the sensor.
